# Master Theorem

Used for many divide-and-conquer recurrences

$$T(n) = aT(n/b) + f(n),$$

where  $a \geq 1$ ,  $b > 1$ , and  $f(n) > 0$ .

$a$  = (constant) number of sub-instances,

$b$  = (constant) size ration of sub-instances,

$f(n)$  = time used for dividing and recombining.

# Divide-and-Conquer: Binary Search

# Binary Search

Find a value  $v$  in a sorted array of elements.

$[a_0 \leq a_1 \leq, \dots, \leq a_{\text{size}-1}]$

Size = number of elements.

# Binary Search

**Algorithm:** **binarySearch**( $a, v, low, high$ )

**Input:** array  $a$ , value  $v$ , lower and upper bound indices  $low, high$  ( $low = 0, high = n - 1$  initially)

**Output:** the index  $i$  of element  $v$  (if it is present),  $-1$  (if  $v$  is not present)

```
if  $low == high$  then
    if  $a[low] == v$  then
        return  $low$ 
    else
        return  $-1$ 
    end if
else
     $mid \leftarrow (low + high)/2$ 
    if  $v \leq a[mid]$  then
        return binarySearch( $a, v, low, mid$ )
    else
        return binarySearch( $a, v, mid + 1, high$ )

**Best known:**  $n \log n 2^{O(\log^* n)}$
