

**McGill**DECEMBER 2011  
Final Examination

## FINAL EXAMINATION

**Computer Science COMP-547A**  
***Cryptography and Data Security***

16 DECEMBER 2011, 14h00

Examiner:	Prof. Claude Crépeau	Assoc Examiner:	Prof. David Avis
-----------	----------------------	-----------------	------------------

**INSTRUCTIONS:**

- This examination is worth 50% of your final grade.
- The total of all questions is 105 points.
- Each question heading contains (in parenthesis) a list of values for each sub-questions.
- This is an **open book** exam. **All documentation is permitted.**
- Faculty standard calculator permitted only.
- The exam consists of 5 questions on 4 pages, title page included.

**Suggestion:****read all the questions and  
their values before you start.**

**Question 1. Pseudo-random function ? (5+5+5+5 = 20 points)**

Let  $f_k$  for  $k \in \{0,1\}^n$  be a candidate pseudo-random function family.

- i) Suppose  $f_k$  and  $f_{\bar{k}}$  are actually the same exact function, for all possible values of  $k$ . Does that contradict the pseudo-randomness of  $f_k$ ? Explain your answer.
- ii) Suppose  $f_k(000\dots 0) = 000\dots 0$  for all possible values of  $k$ . Does that contradict the pseudo-randomness of  $f_k$ ? Explain your answer.
- iii) Suppose  $f_k(000\dots 0) = k$  for all possible values of  $k$ . Does that contradict the pseudo-randomness of  $f_k$ ? Explain your answer.
- iv) Suppose  $f_k(k) = k$  for all possible values of  $k$ . Does that contradict the pseudo-randomness of  $f_k$ ? Explain your answer.

**Question 2. Number Theory (8+7 = 15 points)**

Let  $N=143$  be an RSA modulus.

- Find all the square roots  $r$  ( $1 \leq r \leq N$ ) of  $1 \pmod{N}$ .
- Give  $r_0$  and  $r_1$  that are two square roots of 1 such that  $r_0 \not\equiv \pm r_1 \pmod{N}$ .
- What are  $\gcd(r_0 - r_1, N)$  and  $\gcd(r_0 + r_1, N)$ ?

7.10 Corollary 7.21 shows that if  $N = pq$  and  $ed = 1 \pmod{\phi(N)}$  then for all  $x \in \mathbb{Z}_N^*$  we have  $(x^e)^d = x \pmod{N}$ . Show that this holds for all  $x \in \mathbb{Z}_N$ .

**Hint:** Use the Chinese remainder theorem.

**Question 3. Negligible (5+5+5 = 15 points)**

Remember

**DEFINITION 3.4** A function  $f$  is negligible if for every polynomial  $p(\cdot)$  there exists an  $N$  such that for all integers  $n > N$  it holds that

$$f(n) < 1/p(n)$$

**A)** Give an example of a negligible function and prove it is.

We can define non-negligible by simply changing as follows

**DEFINITION 3.4\*** A function  $f$  is non-negligible if there exists a polynomial  $p(\cdot)$  such that for all integers  $n$  it holds that

$$f(n) > 1/p(n)$$

**B)** Give an example of a non-negligible function and prove it is.

**C)** Give an example of a function which is neither negligible nor non-negligible and prove it is.

**Question 4. Mac & Signature (7+7+7 = 21 points)**

1) Explain why the term “Signature” is only used for the public-key setting.

2) Explain why textbook RSA is NOT existentially unforgeable.

3) It is possible to have MACs that are secure without computational assumptions. Why not signatures ?

**Question 5. CPA security vs insecurity... (10+8+8+8 = 34 points)**

i) Suppose pseudo-random permutations exist. Give two constructions of **CPA**-secure encryption schemes (for arbitrary-length messages) with identical key space.

You are given two **CPA**-secure encryption schemes  $\mathbf{E}_1=(\mathbf{Gen},\mathbf{Enc}_1,\mathbf{Dec}_1)$ , and  $\mathbf{E}_2=(\mathbf{Gen},\mathbf{Enc}_2,\mathbf{Dec}_2)$  that share the same key-space and have the same key generation algorithm **Gen**.

ii) Consider the combined cryptosystem where encryption is the pair  $(\mathbf{Enc}_{1,k_1}(m),\mathbf{Enc}_{2,k_2}(m))$  where encryptions are done using INDEPENDENT KEYS  $k_1, k_2$ . Explain why this resulting system is still **CPA**-secure.

iii) Consider the combined cryptosystem where encryption is the pair  $(\mathbf{Enc}_{1,k}(m),\mathbf{Enc}_{2,k}(m))$  where both encryptions are done using THE SAME KEY  $k$ . Explain why this resulting system might NOT be **CPA**-secure.

Suppose I give you a **CPA**-secure encryption  $\mathbf{E}_0=(\mathbf{Gen}_0,\mathbf{Enc}_0,\mathbf{Dec}_0)$ .

iv) Using  $\mathbf{E}_0$ , give an example of such systems  $\mathbf{E}_1, \mathbf{E}_2$  with properties as in iii). ( You should involve  $\mathbf{E}_0$  into the construction of  $\mathbf{E}_1$  and of  $\mathbf{E}_2$  so that they are as secure individually as  $\mathbf{E}_0$  but not together... )

**HINT:** Put an apparent useless part in encrypted messages that will reveal the key when you get both  $\mathbf{Enc}_{1,k}(m)$  and  $\mathbf{Enc}_{2,k}(m)$ .
